DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claims 5-8, 11-12, 16, 19, 27-48 and 67-75 are rejected under 35 U.S.C. 103(a) as being unpatentable over Oka (JP '915) in combination with Liu et al. (US '826) and in combination with Kuznetsov (Inst. Phys. Conf) and in combination with Kumomi.

Oka discloses a method of manufacturing a semiconductor device for the formation of an active matrix type electro-optical display having a driving circuit portion and display portion comprising the steps of forming an amorphous Silicon layer on a glass substrate by PECVD (pg. 6, translation), selectively forming a Ni layer (pg. 14, translation) of a thickness of 100-200 Angstroms on a-Si layer in seed regions outside the regions slated to become TFT active regions, such that Ni does not diffuse into said active regions by abnormal diffusion. Therefore, the Ni is introduced into the seed regions by solid source diffusion. The method further discloses thermally heating the Ni at 450 C° (pg. 6, translation) such that the Ni catalyst would diffuse through the semiconductor film forming crystal nuclei near the interface between the metal layer and the a-Si layer (pg. 7, translation). After diffusion of the catalyst through the semiconductor film, the metal layer is removed to prevent abnormal diffusion (i.e. diffusion into the active layer of the TFT as defined pg. 7 of translation). The method also

Application/Control Number: 08/811,742

Art Unit: 2823

includes formation of semiconductor islands (fig. 2b) comprising of a first region and the formation of a semiconductor island comprising of a second region. Examiner previous official notice was not adequately contested, therefore, it is taken as admitted prior art that the formation of semiconductor islands is notoriously obvious in the art in order to provide device isolation.

Kuznetsov teaches that metal catalyst induced crystallization occurs by lateral diffusion of the metal throughout the a-Si film. In addition, Kuznetsov teaches a concentration of Ni+ ions to a maximum concentration of about 1.5x10²⁰ atoms/cm³. (pg. 191-194) Thus, such diffusion, while not explicitly taught by Oka, is inherent in the process of Oka as a result of the metal induced lateral crystallization. In reference to amended claims 27, 31, 33, 36, 42, 45, and 47, a-Si is then thermally crystallized at 550 C°, where the grain nuclei ordinarily formed in the seed regions and grain growth proceeds from said seed regions parallel to the substrate surface and TFT charge carrier flow (fig. 5-8). TFTs are subsequently formed in the crystal growth region. The thin film transistor contains crystallized region 105 in FIG. 1C and in FIG. 1D forms source-drain region 107 within the crystallized region. Thus, the crystals would inherently be formed along the source-drain region.

Oka does not explicitly anticipate leaving areas of the film amorphous.

However, Liu teaches forming regions of a-Si on Corning 7059 glass and some of the regions that were not treated with Ni prior to a low temperature thermal treatment remain amorphous, while a-Si regions that were treated with Ni are crystallized into polysilicon after said thermal treatment (Example 2). Liu teaches the selective

Art Unit: 2823

crystallization of certain regions is advantageous because it allows simultaneous formation of driver TFTs that require a low leakage current in the amorphous regions (col. 3, lines 10-17).

Page 4

Therefore it would have been obvious to one of ordinary skill in the requisite art to leave a second region (disposing nickel in contact with a selected region of only the first region of the semiconductor film) of Oka amorphous by not providing a seed region. One of ordinary skill in the art at the time of the invention would have been motivated by Liu's teachings. That is in order to simultaneously obtain driver TFTs of high mobility in the polysilicon regions and pixel TFTS, which require a low leakage current in the amorphous regions. Therefore, Oka would have been motivated to incorporate these teachings of Liu for there disclosed intended purpose.

Kumomi teaches MILE or catalyst enhanced areas crystal growth takes place parallel to the substrate (e.g. MILC). It is held, absent evidence to the contrary, that crystal growth of Oka would occur by this mechanism, as it is a fundamental characteristic of the process. See In re Best, 195 USPQ 428 (CCPA 1977) and In re Fitzgerald, 205 USPQ 594 (CCPA 1980).

Claims 9-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Oka
 (JP'915), in combination with Liu et al. (US '826) and in combination with Kuznetsov
 (Inst. Phys. Conf) and in combination with Kumomi as applied to claims 5-8, 11-12, 16, 19, 27-48 above, and further in view of Yonehara (US '093) and/or Shibata (US '224 or JP ' 224).

Page 5

Application/Control Number: 08/811,742

Art Unit: 2823

Oka and Liu lack anticipation for irradiating the polysilicon after the thermal crystallization.

Yonehara and/or Shibata teach the irradiating the polysilicon after a thermal crystallization in order to improve the properties of the film, such as mobility. It would have been obvious to one of ordinary skill in the art to irradiate the polysilicon of Oka and Liu after the thermal crystallization in order to improve its mobility as taught by Yonehara and/or Shibata.

Claim 26 is rejected under 35 U.S.C. 103(a) as being unpatentable over Oka (JP '915) in combination with Liu et al. (US '826) and in combination with Kuznetsov (Inst. Phys. Cono and in combination with Kumomi as applied to claims 5-8, 11-12, 16, 19, 27-48 above and further in view of Kuznetsov.

Kuznetsov teaches determining Ni concentration in metal induced crystallized silicon using SIMS (sec. 2)

Therefore, it would have been obvious to one of ordinary skill in the requisite art to test the metal induced crystallized silicon of Oka or catalyst containing material of Oka by SIMS to check for the presence of and to determine the distribution of deleterious metal impurities (Oka, pgs. 10-11 of translation) as taught by Kuznetsov.

Response to Amendment

Response to Applicant's Arguments

Applicant's arguments filed 02-25-2003 have been fully considered but they are not persuasive.

Application/Control Number: 08/811,742

Art Unit: 2823

In response to Applicant's argument that Oka fails to show any arrangement of the source drain regions in an island region, Oka discloses on pages 8-12 and FIGS. 1-8 wherein the first thin film transistor is so arranged that the crystal extend along with a direction connecting source and drain regions 108 of the first thin film transistor. The thin film transistor contains crystallized region 105 in FIG. 1C and in FIG. 1D forms source-drain region 107 within the crystallized region. Thus, the crystals would inherently be formed along the source-drain region.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Khiem D Nguyen whose telephone number is (703) 306-0210. The examiner can normally be reached on Monday-Friday (8:00 AM - 5:00 PM).

Art Unit: 2823

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chaudhuri Olik can be reached on (703) 306-2794. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 746-9179 for regular communications and (703) 746-9179 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0956.
